Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Customer Problem Statement

The problem statement focuses on the user's difficulty in accessing records securely. The project scenario requires users to view records only when the Branch field matches their authorized branch, while administrators must retain full access.

Problem Statement Format: I am / I'm trying to / But / Because / Which makes me feel

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	an EEE branch user	view and work with records belonging to the EEE branch	I may be able to view records that belong to another branch if access is not controlled at record level	normal role-based access alone may not check the Branch field of each record	concerned about unauthorized access and loss of data confidentiality
PS-2	a user from a non-EEE branch	access only the records that I am authorized to view	the system may expose records from other branches when field-level conditions are not enforced	the application needs a condition-based ACL that evaluates the record's Branch value	uncertain about whether my data is properly protected
PS-3	an administrator	manage and view all branch records when necessary	strict branch restrictions could unintentionally block administrative work	administrators require an explicit exception with full access	frustrated if security controls interfere with legitimate administration

Core Problem Statement:

Users need a record-level access mechanism that checks the Branch field before allowing access, so that only authorized EEE users can view EEE records while administrators retain full access.
