

Project Requirement Analysis Phase

Solution Requirements (Functional & Non-functional)

Date	01 October 2026
Team ID	SWTID-2026-7951
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Following the supplied template, the requirements are divided into Functional Requirements and Non-functional Requirements. The source template uses FR No., Functional Requirement (Epic), Sub Requirement (Story/Sub-Task), and NFR No., requirement and description. [filecite](#)[turn1file3](#)[L8-L26](#)

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Identity & Access Context	Identify the logged-in user; retrieve the user's role and authorized branch information.
FR-2	Branch-Based Record Access	Evaluate the record's Branch field before allowing the user to view the record.
FR-3	EEE Branch Restriction	Allow EEE users to view records where Branch = EEE; deny access when the required condition is not satisfied.
FR-4	Administrator Full Access	Allow administrators to view records across branches without being blocked by the EEE branch condition.
FR-5	Access Denial Handling	Prevent unauthorized record viewing and return the normal platform access-denied behaviour.
FR-6	ACL Validation & Testing	Validate the rule with EEE users, users from another branch, and administrators using representative records.

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	Access decisions should be transparent through normal platform behaviour; users should not need to perform manual permission checks.
NFR-2	Security	The ACL must enforce record-level authorization based on the Branch field and preserve administrator access. Unauthorized users must not receive the protected record.
NFR-3	Reliability	The access rule should produce consistent decisions for the same user, role and Branch value, including explicit handling of administrators.
NFR-4	Performance	The ACL script should use simple, efficient checks so authorization does not add unnecessary delay to record access.
NFR-5	Availability	The access-control mechanism should operate whenever the application and its user/record data are available.
NFR-6	Maintainability / Scalability	The script should be readable and structured so the rule can be extended to additional branches or roles without redesigning the entire access model.
