

Project Design Phase

Proposed Solution Template

Date	01 October 2026
Team ID	SWTID-2026-7951
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

The template requires: Problem Statement, Idea/Solution description, Novelty/Uniqueness, Social Impact/Customer Satisfaction, Business Model (Revenue Model), and Scalability.

filecite turn2file1 L8-L17

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Users may view records they are not authorized to access when record-level security does not evaluate the Branch field. The requirement is to allow EEE users to view records where Branch = EEE, deny unauthorized branch users, and preserve full administrator access.
2	Idea / Solution description	Implement a script-controlled ACL on the target record. The ACL evaluates the logged-in user's role and branch against the record's Branch value. Administrators are allowed; otherwise, access is granted only when the required branch condition is satisfied.
3	Novelty / Uniqueness	Combines role-based authorization with a record-field condition. The decision is made at individual-record level instead of granting broad table access. An explicit administrator exception preserves legitimate administration.
4	Social Impact / Customer Satisfaction	Improves data confidentiality and user trust. EEE users receive relevant records while unauthorized users are prevented from viewing restricted records. Administrators can continue management without unnecessary restrictions.
5	Business Model (Revenue Model)	Primarily an internal security enhancement, not a standalone revenue product. Enterprise value comes from reduced operational risk and potential implementation, configuration, maintenance and support services.
6	Scalability of the Solution	The approach can be extended to additional branches, roles and sensitive tables by evaluating user/record attributes. The ACL logic can be reused and maintained as authorization requirements grow.
