

Project Development Phase

ACL Performance & Implementation Test

Date	01 October 2026
Team ID	SWTID-2026-7951
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	10 Marks

The development template asks for a Model Summary, accuracy/training-validation results and fine-tuning when applicable. For this non-ML ACL project, those fields are translated into implementation summary and authorization-validation results; training accuracy, validation accuracy and model confidence are not applicable.

S.No.	Parameter	Values / Project Result	Screenshot
1	Solution Summary	ServiceNow script-controlled ACL that checks the logged-in user's authorization context against the record's Branch field. EEE users can view EEE records; administrators retain full access; unauthorized users are denied.	Insert ACL configuration screenshot
2	Authorization Accuracy	EEE user → EEE record: Expected Allow. Non-EEE user → EEE record: Expected Deny. Administrator → EEE/non-EEE record: Expected Allow.	Insert test-result screenshots
3	Consistency Validation	Repeated tests with the same user, role and Branch value should return the same authorization result.	Insert repeated-test screenshot
4	Edge-Case Validation	Empty/unexpected Branch values must not accidentally grant restricted access to normal users; administrator access remains available as configured.	Insert edge-case screenshot
5	Performance Validation	Measure representative record-opening response with the ACL enabled. The script should perform a lightweight authorization check without unnecessary database processing.	Insert timing/record-access screenshot
6	Fine-Tuning / Optimization	If required, simplify conditional logic, avoid unnecessary queries, and reuse available user/record fields. Re-test after each change.	Insert revised ACL screenshot if changes are made

Not Applicable:

Training Accuracy, Validation Accuracy, Classification Confidence Score, Confusion Matrix and Hyperparameter Tuning are ML-specific metrics and are not valid measures for a scripted ACL.

Final validation criterion:

All core authorization scenarios must match the defined policy before the ACL is considered ready for release.
